AI CAN DO IT

Tencent Cloud Hackathon

Register Now!

1. Hackathon Overview

Co-hosted by **Tencent Cloud** and **AI Singapore**, the **Tencent Cloud AI CAN DO IT Hackathon Singapore 2026** brings together industry expertise, leading AI technologies, and academic talent to empower the next generation of AI innovators.

Participants will develop practical **Agentic AI solutions** using Tencent Cloud's latest AI products, including CodeBuddy, WorkBuddy, Miora and other relevant tools and technologies, to tackle real-world business challenges contributed by leading organizations across industries.

The Hackathon will feature FIVE industry tracks: **Banking, Real Estate, FinTech, Digital Native,** and **Healthcare.** Each track will be supported by leading industry organizations that will contribute real-world challenge statements and participate in the evaluation and judging of solutions.

Participants will also receive training and technical support throughout the Hackathon to help turn their ideas into working solutions.

Join now for a first-hand opportunity to solve real industry challenges, connect with industry leaders, compete for exciting prizes, and showcase your innovation at the Grand Final!

Join us and discover what AI can do!

5. The Digital Native Track - Ryde

Description:

The Digital Native Track features real-world business challenges contributed by Ryde, a Singapore-headquartered ride-hailing and carpooling platform.

Participants will tackle industry-relevant problem statements and leverage AI technologies to develop practical, impactful solutions for the mobility and digital services sector.

Requirement:

This challenge presents **ONE** real-world enterprise challenge statements.

Each team is required to select only **ONE** case study to solve.

Please clearly indicate your chosen case study at the beginning of your presentation.

Challenge Statement:

Multi-Agent Autonomous Dispute Resolution System

Introduction

Ride-hailing companies process thousands of dispute tickets daily — ranging from fare disputes and route deviations to property damage, safety incidents, and no-show charges.

These disputes are complex, subjective, and emotionally charged, requiring human agents to manually review GPS telemetry, chat logs, photos, payment records, and company policy before reaching a decision.

This current approach results in:

- High operational costs — millions spent annually on human support hours
- Slow resolution times — typically 24–72 hours per dispute
- Inconsistent rulings — different agents reach different conclusions on similar cases
- User churn — customers who feel unfairly treated leave the platform

Problem Statement

Build an autonomous, multi-agent dispute resolution system that can handle complex, multi-party conflicts between riders and drivers — gathering evidence, building cases, applying company policy, and issuing fair rulings quickly, transparently, and without human intervention for the majority of standard dispute categories.

What the Solution Should Solve

The AI Agent Solution — Multi-Agent Architecture

1. MVP (Required) — Core Agents

Teams must implement the following three core agents. These agents should operate on text-based and structured data evidence (GPS coordinates as data points, chat logs, fare breakdowns, timestamps).

Agent	Role	Required Capabilities
Rider Advocate Agent	Represents the rider's perspective	Gathers rider-side evidence, articulates the rider's claim based on company policy, and argues for rider-favorable outcomes.
Driver Advocate Agent	Represents the driver's perspective	Gathers driver-side evidence, articulates the driver's defense based on policy, and argues for driver-favorable outcomes.
Judge Agent	Acts as the impartial arbitrator	Weighs evidence from both advocates, applies company policy, issues a final ruling (refund, compensation, no action), and generates a natural language explanation of its reasoning.

MVP Evidence Sources (Text & Structured Data):

- **GPS & Telemetry Data** — Route deviation analysis (comparing actual route vs. optimal route as data points), unexpected stops, trip duration vs. estimated time
- **Chat & Communication Logs** — Text analysis for sentiment, agreements, disagreements, and threats
- **Payment & Fare Data** — Fare breakdown validation, surge pricing disputes, promo code usage
- **Historical Behavior Profiles** — Rider and driver dispute history, rating patterns, account age

MVP Workflow:

- A dispute is filed (e.g., "The driver took a longer route and I was overcharged.")
- The Rider Advocate Agent and Driver Advocate Agent autonomously gather their respective evidence from the available data sources.
- Each advocate builds and presents its case, citing relevant company policy.
- The Judge Agent reviews both cases, applies policy, and issues a ruling with a confidence score and natural language reasoning summary.
- The system outputs the ruling, recommended action (e.g., partial refund of $3.25), and explanation to both parties.

2. Stretch Goals (Bonus Points) — Advanced Agents & Multi-Modal Capabilities

The following are optional enhancements for teams that have completed the MVP and wish to demonstrate deeper technical capability. Implementing these will earn bonus points in the judging criteria.

Agent / Capability	Role	Why It's a Stretch Goal
Evidence Collection Agent	Autonomously orchestrates multi-modal data retrieval across all tools and APIs, feeding structured evidence to the advocate agents.	Adds orchestration complexity; requires tool-use and API integration design.
Fraud & Bad-Faith Detection Agent	Runs in parallel to assess whether either party exhibits patterns of dispute abuse, fake claims, or collusion. Feeds risk signals to the Judge Agent.	Requires behavioral modeling and risk scoring beyond the core dispute flow.
Policy & Precedent Agent	Maintains a dynamic knowledge base of company policies and past dispute rulings. Provides the Judge Agent with precedent-based recommendations for ruling consistency.	Requires building and querying a precedent knowledge base (e.g., RAG architecture).
Image Analysis (Multi-Modal)	Analyzes "mess" or damage photos for validity — checks if the photo is genuine, matches the trip timestamp, and is not AI-generated.	Introduces computer vision / multi-modal LLM capabilities — a significant technical leap.
Escalation Protocol	Confidence-scoring mechanism. When the Judge Agent's confidence falls below a threshold, it autonomously escalates to a human reviewer with a full case summary.	Adds conditional logic, threshold tuning, and human-in-the-loop design.
Learning Feedback Loop	When a human reviewer overrides the Judge Agent's ruling, the correction is captured and fed back into the Policy & Precedent Agent's knowledge base for continuous improvement.	Requires feedback ingestion and knowledge base updating — advanced system design.
SLA & Routing Manager	Prioritizes disputes by urgency and value. High-priority disputes (e.g., safety-related) are fast-tracked.	Adds a queue management and prioritization layer.

3. Strategic Guardrails for Participants

To ensure teams deliver a working prototype within the hackathon timeline, the following guardrails apply:

Scope Management

The three Core Agents handling text-based and structured evidence are the required deliverable. Teams will be evaluated primarily on this.

Advanced Agents, image processing, and multi-modal capabilities are stretch goals. Teams should only attempt these after the MVP is fully functional.

Teams are encouraged to mock or simulate external APIs and data sources where real APIs are unavailable. A sample dataset will be provided.

Technical Constraints

Teams may use any LLM or AI agent framework of their choice (e.g., LangChain, AutoGen, CrewAI, or custom implementations).

The system should be demoable — a working end-to-end flow for at least two dispute categories (e.g., route deviation + no-show charge) is expected by Demo Day.

Inter-agent communication should be observable — judges should be able to see how agents exchange information and build their cases (e.g., via a visible communication log or UI).

Dispute Categories (Sample)

Teams should ensure their system can handle at least two of the following dispute types:

	Dispute Type	Example
1	Route Deviation	"Driver took a longer route and I was overcharged."
2	No-Show Charge	"Driver didn't show up but I was charged a cancellation fee."
3	Property Damage / Mess	"Rider spilled drinks in the car and driver is claiming cleaning fees." (requires image analysis — stretch goal)
4	Safety Incident	"Driver behaved inappropriately during the trip."

The Solution Should Include

- **Working Prototype** – An end-to-end solution capable of handling at least two dispute categories.
- **Architecture Diagram** – A clear visual representation of the multi-agent system and key components.
- **Demo Walkthrough** – A live demonstration showing how a dispute is processed and resolved autonomously.
- **Source Code** – Complete source code submitted through a GitHub repository.

Note: *The features listed above are provided as guidance only. Participants are strongly encouraged to explore alternative approaches that meaningfully address the problem statement.*

7. Suggested Tools

Tencent Cloud WorkBuddy Ecosystem

The following tools are all accessible through WorkBuddy's built-in ecosystem — no complex development environment setup required. Operate everything via natural language.

Area	Recommended Tools	Description
Agent Development	WorkBuddy	• An AI-native workspace that enables users to build, deploy, and manage intelligent agents and automations through a natural-language interface, integrating large language models, MCP connectors, skills, and scheduling to automate real-world tasks across business workflows.
Agent Development	CodeBuddy	• Tencent Cloud's AI coding assistant that provides intelligent code completion, code review, debugging, and multi-file editing capabilities within the developer's IDE, accelerating software development with context-aware suggestions.

Tencent Cloud Services Recommended for Hackathon Challenges

Area	Recommended Tools	Description
Agent Development	Tencent Cloud Agent Development platform(ADP)	• Tencent Cloud's foundational infrastructure for building AI agents at scale, offering model orchestration, sandboxed runtime environments, tool-calling frameworks, and extensible plugin ecosystems that allow developers to compose multi-agent systems with guardrails, RAG, and human-in-the-loop controls.
Visual Asset	Miora	• An AI-native creative studio that generates production-grade visual assets – including images, videos, 3D elements, and user interfaces – directly from natural language descriptions.
Agent runtime sandbox	Tencent Cloud Agent Runtime	• Agent Runtime uses a secure sandbox as its core execution environment, supporting millisecond-level startup and concurrency of tens of thousands of instances. It provides a secure, isolated, and high-performance execution foundation for AI Agents.
Speech & Voice	ASR from Tencent Cloud TRTC	• Real-time and batch speech-to-text recognition with multi-accent support, used to transcribe spoken transaction commands into text for intent parsing.
Speech & Voice	TTS from Tencent Cloud TRTC	• Natural text-to-speech synthesis for voice-based clarification prompts and confirmation overlays in the conversational banking experience.
Big Data / Database / Storage / Compute / Container / Network	Tencent Cloud	• Tencent Cloud provides the full underlay infrastructure.

8. Project Submission Requirements

Project Basic Requirements

The project must be original and built on at least one of the products CodeBuddy or WorkBuddy.

Proof of product usage is mandatory: chat screenshots, API call logs, or a written development-process description. Without proof, the project will not proceed to scoring.

Submission Requirements

Submission Items	Req.	Description
Project title	Required	• The name of your AI Agent project
Short blurb	Required	• A summary of what your project does or the value it delivers. Hard limit: under 10 words
Project Description	Required	• Project Overview: Target Scenarios, Users, and Value Proposition • Real-World Scenario Insights: Source of Pain Points, Target Audience, and Core Problems Solved • Comprehensive Solution Design: business and technical architecture, and how prompts drive the AI generation. • Business Value: quantifiable metrics or clearly defined impact.
CodeBuddy / WorkBuddy Conversation History	Required	• Minimum of 3 screenshots/screen recording of your chat logs from CodeBuddy or WorkBuddy during the development process
Cover Image	Required	• A 16:9 cover image for your project, used for the online showcase. Recommended size: 380×216px.
Demo video	Optional	• A 5–8 minute video covering: • Project overview • Core Agent features and how it's used • A short reflection on your build approach and any development tool tips with reference to CodeBuddy/WorkBuddy
Project link	Optional	• A live URL or demo link for your project. Optional, but earns bonus points.
Other Requirements as per the Challenge Statement	Optional	• Please check the respective challenge statement for specific requirements.

9. Competition Timeline

16 Sept 2026: Challenge Kick-off

Challenge launch & submissions open

16 Sept - 16 Oct 2026: Online & Offline Training

Hands-on workshops

16 Oct 2026: Project Submission

23 Oct 2026 : Finalist Announcement

Shortlist Top 2 teams per track for Demo Day

3 Nov 2026 (TBC): Singapore Hackathon Demo Day

Crown the Winners

10. How to Participate

Step 1: Register

Sign up via the registration link below. Only **one registration** per team is required. Each team may consist of **1–3 members**, and all participants must be based in Singapore.

Registration Link: https://qdrl.qq.com/65xN1yft

Step 2: Join the WhatsApp Group and Receive the Hackathon Handbook

You will be invited to join the respective track's **WhatsApp Group**, and the Hackathon Handbook will be sent to you via email.

Step 3: Create Your Accounts and Claim Your Credits

Each team member may create CodeBuddy, WorkBuddy, and Miora accounts to receive complimentary credits and access Tencent Cloud's AI-powered development tools.

Step 4: Build and Submit Your Project

Develop your project using CodeBuddy, WorkBuddy, or Miora, and submit it before the deadline.

Project Submission Link:
https://tinyurl.com/TCHackathonSGProjectSubmission

11. Judging Process

- **Preliminary Technical Judging:** Each project will be evaluated by **the respective industry organization that contributed the challenge statement** and **Tencent Cloud experts**. As each track has different objectives and requirements, the detailed judging criteria will be shared with participants after registration.
- **Demo Day Grand Final:** Representative teams from participating schools present their projects live at the offline roadshow. Judges score each project based on theme alignment, use of AI tools, and game quality, and select regional award winners and teams advancing to the grand final, please refer to the following:

Evaluation Dimension	Score	Key Review Focus
Impact & Relevance	10 Points	Evaluate whether the project addresses a real-world problem and creates meaningful value.
Human-Centered Design	10 Points	Assess how well the solution is designed for real users.
AI Interaction	10 Points	Evaluate the quality and depth of AI usage in the project.
Technical Execution	10 Points	Assess the technical quality and completeness of the project.
Feasibility	10 Points	Evaluate whether the project is realistic and scalable beyond the hackathon.
Demo & Storytelling	10 Points	Assess how effectively the project is presented and communicated.
Innovation & Creativity	10 Points	Evaluate the originality and uniqueness of the project.
User Experience (UX) & Accessibility	10 Points	Assess the overall usability and accessibility of the solution.
Responsible AI & Ethics	10 Points	Evaluate whether the project demonstrates responsible and trustworthy AI practices.
Overall Quality & Judge's Impression	10 Points	Provide an overall assessment of the project.

12. Participant Benefits and Awards

Registration Benefits - For All Participants

Track tool	Credit Allocation
CodeBuddy/WorkBuddy	1,000 credits / person
Miora	1,000 credits / person

Grand Final Awards

The top 2 teams from preliminary judging will present at the Grand Final Demo Day on 3rd November 2026 , competing for the grand prizes below.

Award	Team Quota	Prize
First Prize	1	SGD $10,000
Second Prize	1	SGD $5,000
Third Prize	1	SGD $2,000
Track Winners	5	5,000 CodeBuddy/WorkBuddy Credits

Additional Benefits

Benefit	Description
Internship Fast Track	Outstanding participants may enter the fast-track final interview process for Tencent CSIG internships
POC, Investment & Incubation Opportunities	Outstanding projects may receive opportunities for dedicated project incubation support.
Official Certification	Participants who successfully submit their projects will receive an official Tencent Cloud certificate, featuring a unique traceable verification code and access to an online verification portal.

13. Terms and Conditions

Intellectual Property and Licensing

The intellectual property rights of the entries belong to the individual entrant or team. Entrants must guarantee that their entries are original and do not infringe upon any third-party rights. Entrants grant the organizer (Tencent Cloud) a non-exclusive, royalty-free license to use the project name, description, demo screenshots / screencasts, and team information for non-commercial purposes, such as challenge promotion, case studies, and media coverage. The organizer will credit the project and team when using such materials.

Privacy and Data Statement

The Organiser will collect and process the personal information submitted by participants (such as name, contact details and team information) . Such information will be used solely for the purpose of event registration, judging, notifications, and related publicity or follow-up, and will not be used for unrelated purposes or disclosed to any unauthorised third party. Participants may request access to, correction of, or deletion of their personal information via the official contact channels.

All the best for the Challenge — AI CAN DO IT !
